Bird strikes at home - none

Updated to 06 November 2020

Note: the chart displays the number of days in a given month in which the species was seen. This says nothing of total bird numbers: though commonly with this species one sees but one or a small group in a day. This is a **minimum**, as the observer was not present continuously, not observing from dawn to dusk and, most important of all, not necessarily near the best feeding and roosting sites for the species.
