Likely bird strikes at home - none

Note: the chart displays the number of days in a given month in which the species was seen. This says nothing of total bird numbers: though no more than six have been noted here at any one time. This is a **minimum**, as the observer was not present continuously (some multi-week absences in some years), did not spend long intervals on the major waterways, and was not observing from dawn to dusk.

Common grackle, local summary:

<http://www.turnstone.ca/grackle.htm>

Mar-Apr-May absences of observer in 2016-2019 (and May 2005) will be reflected in low monthly numbers. 28 Feb 2018 was absurdly mild for the season! 26 Nov 2011 also mild.

The noisy, active common grackle is a distinctive, long-tailed variety of North American blackbird, often found with the shorter-tailed red-winged blackbirds and starlings.
